

Introduction to the Imaging FlowCytobot phytoplankton sensor

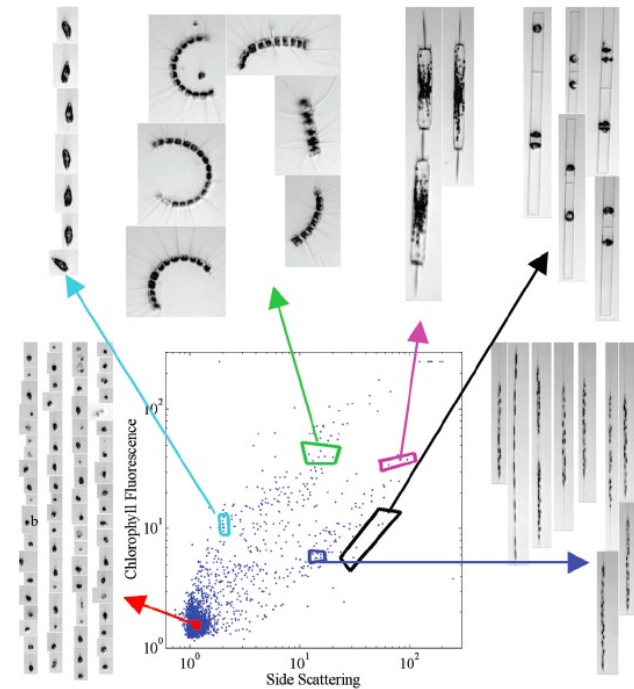

Mike Brosnahan

GlobalHAB symposium on automated in situ observations of phytoplankton

23 August, 2022

IFCB acts as an automated, submersible microscope

IFCB specifications and capabilities

Designed for continuous, in situ operation at depths of up to 50 m, deployment durations of several months

Captures submicron resolution images of particles between 5 and 150 μm long at rates of up to 12 sec^{-1}

Recirculating sheath flow provides:
biofouling protection
hydrodynamic focusing for consistent, sharp imaging

Additional onboard reagents for cleaning, remote QC assessments

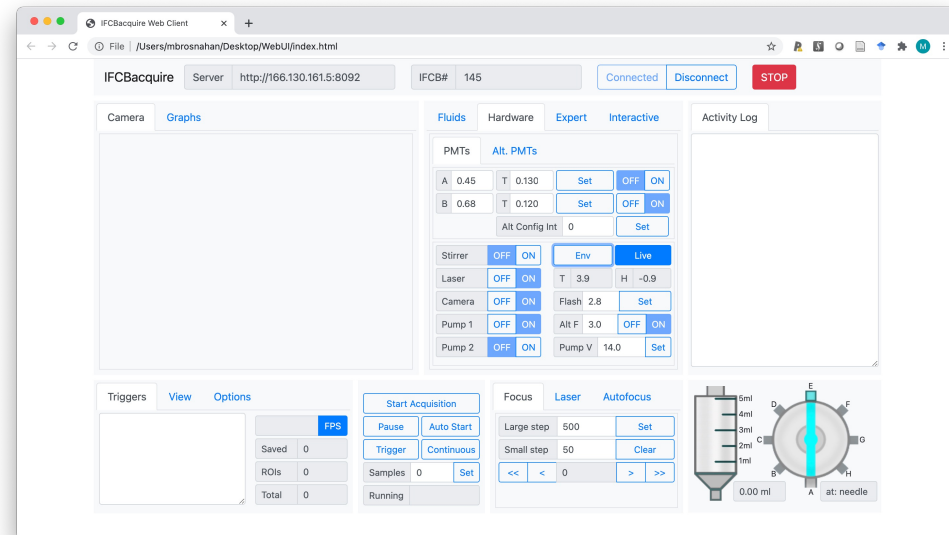

IFCB specifications and capabilities

Power and network connectivity delivered through an underwater cable

Onboard x86_64 computer runs either Windows 10/11 or Debian Linux

LINUX version API

Custom fluidics routines,
low-bandwidth command/
control and monitoring

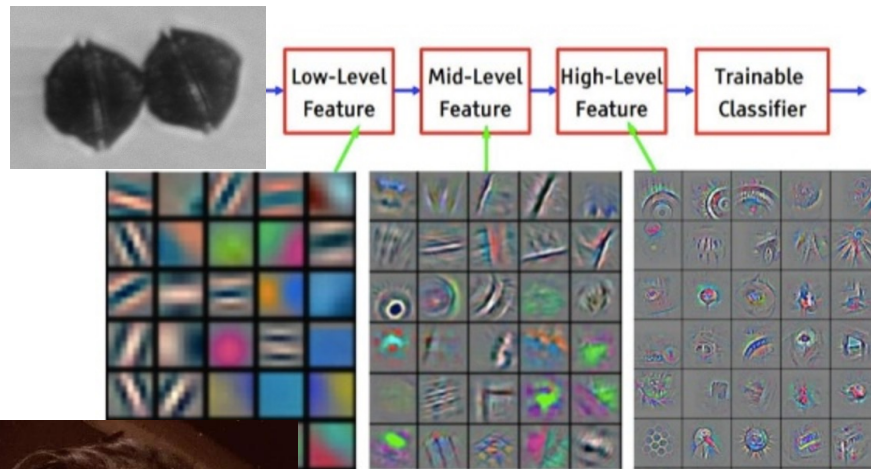

MVCO time series

16+ year time series
begun by Rob Olson
and Heidi Sosik in
2006

1.2 billion images
(9 TB) and growing!

ML models translate images to spp. counts

The screenshot shows the GitHub repository page for 'WHOIGit / ifcb_classifier'. The page includes a search bar, navigation tabs for Code, Issues, Pull requests, Actions, Projects, Wiki, Security, and Insights. The main content area is titled 'Home' and contains a description of the repository: 'Image classification with neural nets is a process by which input images can be binned into certain categories. This git repository is host to an image classifying program designed to be trained and run on plankton images from an IFCB datasource. Please checkout the links on the sidebar to go into more depth on the relevant topic.' Below this is a 'Terminology' section with a list of terms: IFCB, bin, NN, CNN, and Classification. A sidebar on the right contains a 'Pages' section with a list of links: Overview, Installation (local, whoi hpc), Training a Model (Usage: neuston_net TRAIN, Model Parameters, Dataset Parameters, Epoch Parameters, Data Augmentation, Output Options), Running a Model (Usage: neuston_net RUN), Utilities (Combining Datasets, Class Config CSVs, Intensity Normalization), SLURM SBATCH Tool, Dupes Training, and Tips (SLURM and the WHOI HPC, SosIKNAS).

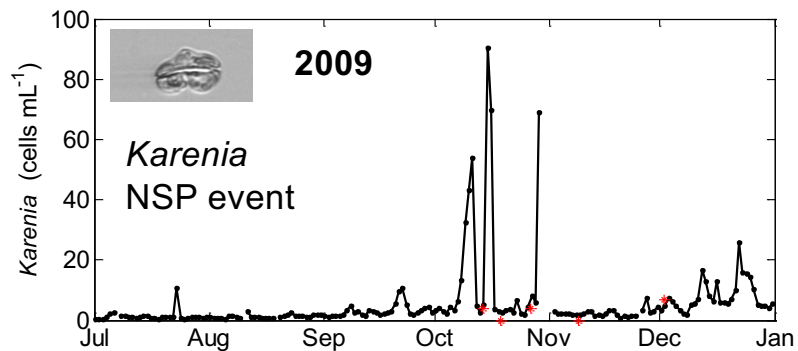

Application to HAB surveillance and monitoring

UT-MSI pier, Port Aransas, TX

The Imaging FlowCytobot is a powerful monitoring tool

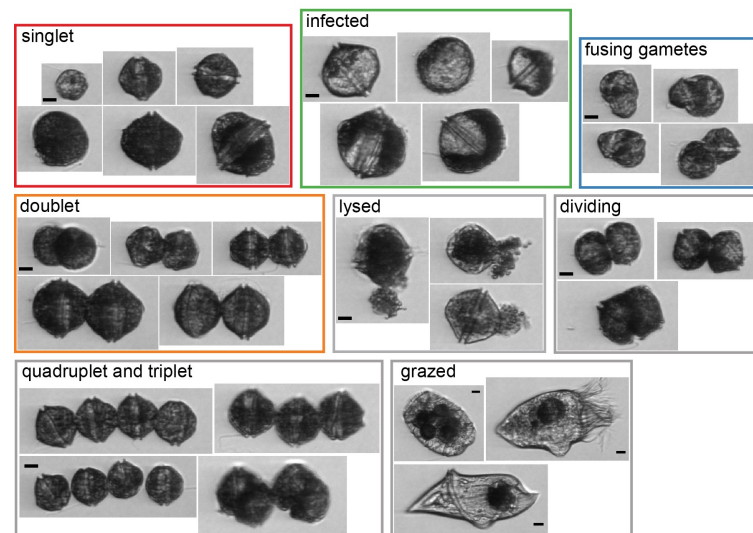

Continuous operation enables detection of patchy blooms

Understanding HAB life cycles, bloom dynamics

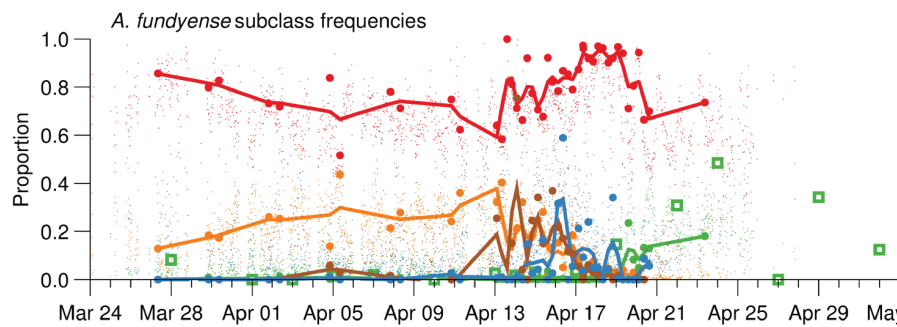

A. catenella cell types

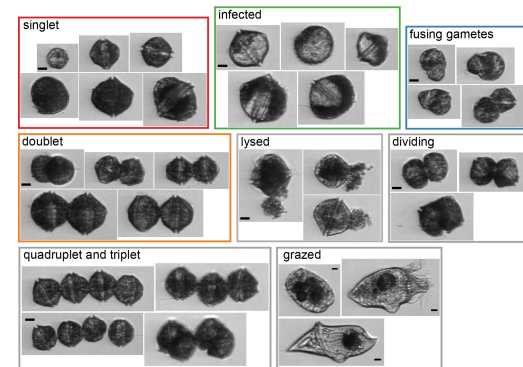

Understanding HAB life cycles, bloom dynamics

Understanding HAB life cycles, bloom dynamics

- Classifier
- Overnight means
- Corrected
- Microscope

- singlet
- doublet
- infected
- F-T mature
- dividing
- fusing gametes

Onset of bloom declines marked by sexual induction and new cyst production

Cell size dynamics to understand in situ physiology

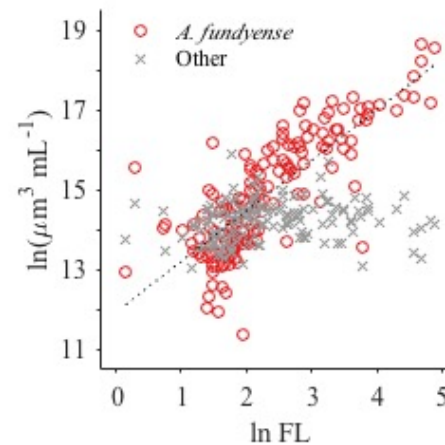

Moberg and
Sosik, 2012

A. catenella grow, produce toxin,
and form gametes much faster than
expected!

Coupling IFCB to a profiling sonde

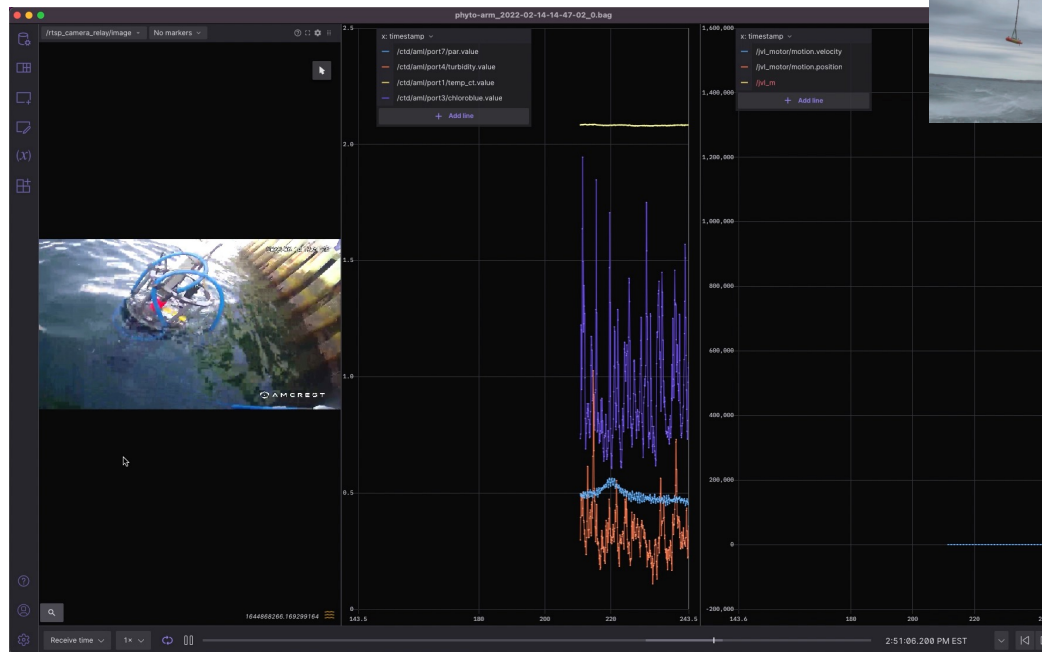

Brosnahan et al. 2017

Near peak of blooms, *A. catenella* is the dominant source of chlorophyll fluorescence

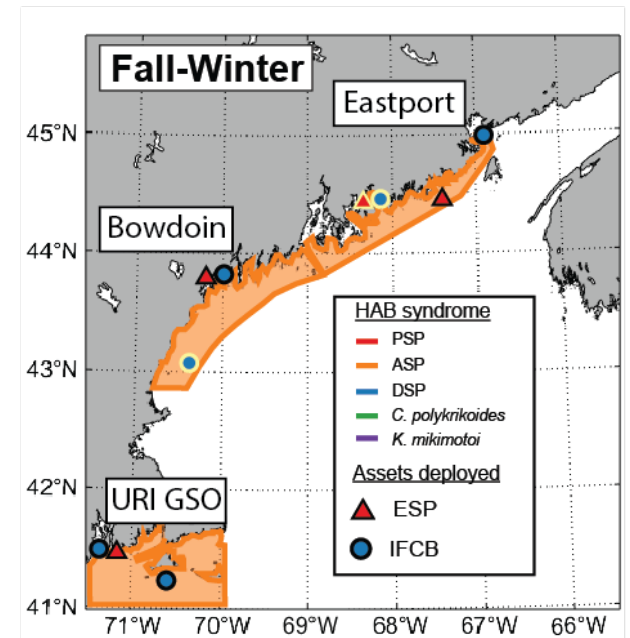

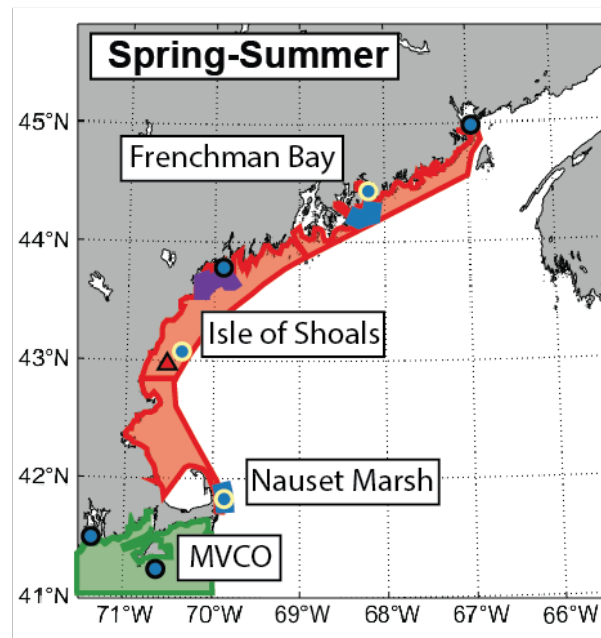

Cells alter their vertical swimming behavior on sexual induction, causing red water

IFCB as a hub for sensor integration

IFCB network development to address changing HABs

Long history of PSP
ASP and DSP are new biotoxin threats
Increasing aquaculture impacts
Impacts are now year-round

Advanced HAB sensors

Imaging FlowCytobot (IFCB)

Automated light microscopy

2G Environmental Sample Processor (ESP)

'Molecular lab in a can'

- Available on-instrument assays detect species-specific nucleic acid markers or toxins
- Measure particulate domoic acid (pDA) and collect archival samples **only when Pn are present**

Fixed site installations

2020 Fixed-site IFCB and IFCB-ESP installations

Year-round

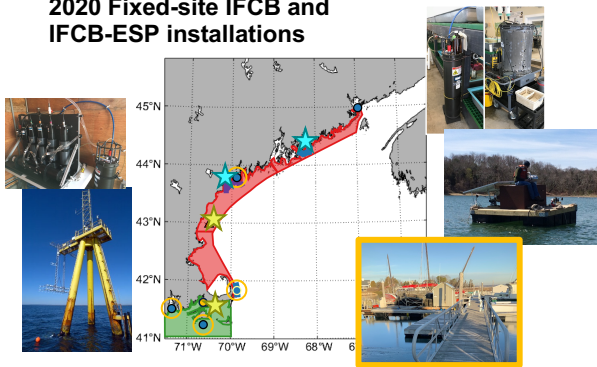

Bowdoin College
Martha's Vineyard
Coastal Observatory
Ward Aquafarm
URI GSO

Seasonal

Nauset Marsh (Aug-Nov)

Adaptive sampling through mobile platforms

2020 Fixed-site IFCB and IFCB-ESP installations

SeaTrac

Offshore IFCB sampling

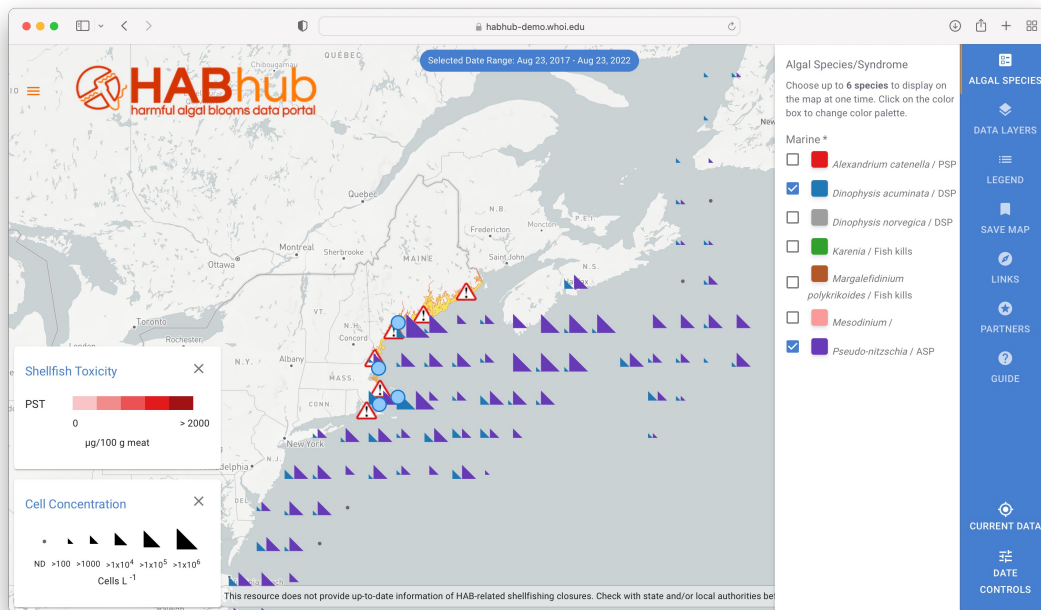

Mobile platforms to enable sensor redistribution across the region as needed

Mooring barge

Supports deployments of IFCB, ESP and profiling CTD

Real time observation

Aim: Make data as accessible as possible

Data classified by CNN within 1-2 h of collection

Results available immediately through an ifcb dashboard and HAB hub

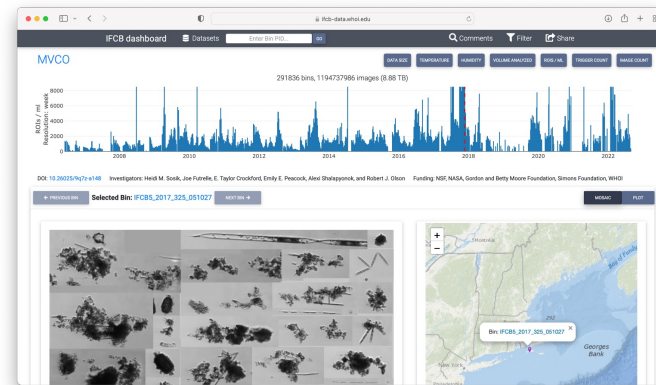

Data sharing and analysis tools!

SMHI

| Summary

IFCBs are well suited for detection and monitoring of many marine HAB species

Emerging as the backbone of new HAB observing systems in the northeast U.S. and elsewhere

Challenges and needs remain in areas of data standards, access/archive, image annotation, sharing of analysis products, and more!
